

Enhanced gob loading with new Constant Cone Bézier Delivery

Constant Cone Delivery

Constant Cone Delivery

Constant cone delivery is the latest Bucher Emhart Glass development for optimal gob loading. The constant cone delivery family is based on a constant trough angle of 28° and covers the full range of forming machines (NIS, BIS, AIS and IS) for all available center distances. The newly developed Bézier equipment, in conjunction with the constant cone geometry, provides for enhanced gob loading.

Optimization criteria are based on:

- Minimizing centripetal accelerations
- Reduce gradually the radial accelerations to zero
- Generate a smooth landing zone
- Increase the length of the deflector profile at the upper end

Key benefits of the new Bézier deflectors design

Smaller curvature design

- Reduced gob entry angle variations
- Reduced gob shape variations
- Increased loading stability

Smoother entry curve path

- Reduced impact forces
- Reduced Normal forces
- Increased loading stability
- Longer coating lifetime
- Reduced gob shape variations

Smaller impact and nominal forces

- Less kinematical energy consumption
- Higher loading speed
- Better gob shape

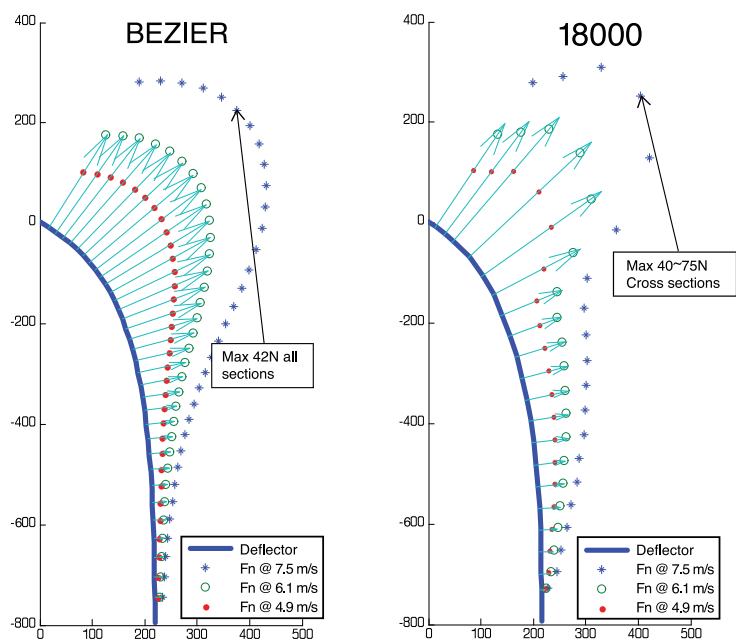

Uniform Normal force distribution on all sections

- Reduced gob speed and gob shape variation from section to section

Upgrade

The extension of the deflector upper end optimizes the landing zone and minimizes the impact forces. When using Bézier deflectors, shorter troughs are needed resulting in improved thermal behavior.

All the existing constant cone delivery can be upgraded to Bézier geometry by replacing deflectors, troughs and suspension forks.

Upgrades of a previous non-constant cone machine are possible by replacing the machine top beam and the related spacers. The retrofit will result in a machine height increase.

Increase of machine height with new constant cone delivery
